Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Carey et al taken with Wycech et al and Kagoshima et al for reasons of record, namely par. 1 of 11/28/00 of the Final Rejection of record (paper # 6).

With regard to the primary reference applicants' arguments regarding the super atmospheric pressure used, foaming and the phosphoric acid used being dehydrated, it is again reiterated that the reason for the use of pressure employed is so that an exothermic reaction can be prevented or controlled. In addition applicants have not shown that the phosphoric acid catalyst employed in the primary reference contains substantially water free (as defined by applicants on page 5 of the instant case as containing less than about 10 % water).

With regard to Kagoshima et al note that the boron trifluoride complex catalyst called for by patentees is a hydrogen donor Lewis acid and would inherently create an exothermic reaction upon contact with the epoxy resin.

Applicants' arguments with regard to Wycech et al have been considered however note that the instant claims are not limited to liquid epoxy resins and is cited to teach that it is well known to use a side A and a side B epoxy resin-catalyst system

containing expandable microspheres which when heated provided during the curing of the epoxy resin composition expand them in situ.

The teachings of the secondary references provide motivation to one skilled in the art to add expandable microspheres and the use of rubbers in the composition of Carey et al.
